ABSTRACT:-

An Analysis to understand the driving factors
behind Loan Defaults.

<Problem solving methodology>

Understanding business objectives

Investigating dataset ,on what attributes has been provided and meaning of each one of it.

Optimizing the Datasets specific to business questions

Performing analysis on optimized dataset

Presenting data visually to make it more understandable

Loan Amount Analysis

Result Summary:-

Loan Default rate increases with increase in Loan Amount.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Interest Rate Analysis

Result Summary:-

Loan Default Rate increases with increase in Interest Rate.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Installment Analysis

Result Summary:-

Loan Default rate slightly increases with increase in installment amount and starts spiking at installment amount greater than 700.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Annual Income Analysis

Result Summary:-

Default Loan rate generally decreases with in increase in annual income with few exceptions.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

dti Analysis

Result Summary:-

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Delinquency in 2yrs Analysis

Result Summary:-

Loan Default rate and Delinquency has positive relationship after delinquency count of 6.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Total enquiry in last 6 months Analysis

Result Summary:-

Loan Default rate increases with increase in enquiry count.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Total Open account Analysis

Result Summary:-

Loan Default rate increases when open account is too low or too large and touches bottom when open account is around 15.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Revolving balance Analysis

Result Summary:-

Loan Default rate increases with increase in revolving balance.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Revolving utility Analysis

Result Summary:-

Loan Default rate slightly increases with increase in revolving utility.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Total account Analysis

Result Summary:-

Loan Default rate decreases with increase in total account.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Result Summary:-

Loan Default rate increases with increase in recorded bankruptcies.

Note:- y axis correspond to defaulted loan that has been normalized to vary between 0 and 1.

Conclusion:-

Few main analytic results have been shared in this Presentation. More results can be found in the analytics notebook.
